Extra Credit:

1. **Adobe** - They use Java, C/C#, C++, PHP for the backend language from what they post on their job openings. They also use JavaScript for the front end web developers. They use a lot of APIs so they like to have people knowledgeable about them. Adobe has been at the number 1 spot on my list for jobs since I was 16:).
2. **Podium** - They use swift, Java, and Kotlin mainly for the backend. They are web based but seem very well rounded. They use javascript for the front end with agile methodology in weekly sprints. The documentation is in confluence. My wife works there and is one of my dream jobs!
3. **Hill Air Force Base** - They use .Net in C# for their language. They do not have a web presence as far as I could find and it makes sense since its the military. You need security clearance as well. They use an agile methodology for their sprints as well. Need to convert classic ASP to ASP.Net in C#.
